
FOR YOU / NO EDITING EXPERIENCE NEEDED

Your first reel.

You bring the idea. Your assistant helps you make it.

Designed by E.B.E - powered by E-VIAS

Give this PDF to your own Codex or Claude Code, together with the companion Community Reels Engine folder. You do not need to know how to code or edit.

I already have a recording

Keep your voice. Clean repeated attempts and awkward gaps. Add captions and visuals that help people understand you.

I want a faceless reel

Start with an idea. Your assistant asks questions, helps write the script, plans the scenes and builds the reel with you. You do not have to appear on camera or arrive with a finished script.

Your part is simple

Answer a few questions. Review the words and previews. Say what feels right and what needs changing. Your assistant handles the tools and files.

Read pages 1-8. Your assistant should also read pages 9-12. Keep the folder and this PDF together: the folder contains the tools; the manual explains how to work with them.

Original materials are free to use, change, share and sell under CC0. Credit is welcome, not compulsory. Third-party terms are separate.

FOR YOU / NO EDITING EXPERIENCE NEEDED

Start a conversation.

Three small actions. No code to learn.

1. Keep the package together

The folder's public home is github.com/eabraheembinessa-E-vias/community-reels-engine. Open it, press the green **Code** button and choose **Download ZIP**, or ask your assistant to download it for you. Extract the ZIP with your computer's normal file manager and keep this manual inside the folder. Use a computer for production; your phone can provide the recording.

2. Open it with your assistant

Open the folder as a local project in Codex or Claude Code. Give the assistant this PDF. If it cannot read the attachment, ask it to read **docs/MANUAL.md** and **docs/ASSISTANT-PLAYBOOK.md** in the folder instead.

3. Send this first message

Read this manual and the companion asset folder. I am a beginner. Guide me one step at a time in my preferred language. Ask whether I have a recording or want a faceless reel from an idea. Ask one useful question at a time and handle the technical work for me. Show me the script or clean cut before adding visuals. Explain any upload or cost before using a provider.

What happens next?

A good first reply is a simple question about your reel. You can answer: "I have a video", "I want a faceless reel", or "I need help choosing an idea." You should not receive a wall of commands.

Only have the PDF? Download the folder from the address in step 1, or ask your assistant to download it for you. A PDF alone does not install software. If your app cannot run local tools, ask it to help you set up a local coding-assistant project.

FOR YOU / NO EDITING EXPERIENCE NEEDED

Let it handle setup.

You provide permission and your private Google key when needed.

Your assistant checks what is already installed, explains anything missing and helps set it up. It can first show a local sample without a Google key. That sample has **\$0 provider API charges**.

1. Open Google AI Studio

Ask your assistant to guide you through the official Google AI Studio key page using your own account. Google may ask you to create or select a project.

2. Create your own key

An API key is a private access key that lets the folder use Google's model through your account. Review billing and data settings. Your Codex or Claude subscription does not pay for Google API use.

3. Enter it privately

Let your assistant open the hidden local entry prompt. Paste the key there, **not into the conversation, a screenshot or a public page**. It should confirm that the key was saved without displaying it.

Before a provider call, your assistant should explain which recording or script will go to Google and its estimated budget. If you already authorized that exact use and budget, it should continue without asking again.

Google availability, free allowances and prices vary. Local editing and rendering use your computer. Ask for the estimated cost before optional narration or image generation. No extras are needed for the included local sample.

If setup fails, ask: "Tell me the one thing I need to do next." Your assistant should explain the problem, not leave you with an unexplained error.

FOR YOU / NO EDITING EXPERIENCE NEEDED

First, clean your recording.

Route A: your voice and meaning stay yours.

What you provide

Your original recording, who it is for and the one message you want people to remember. Tell your assistant what must stay. If you do not know what needs cutting, say so.

What your assistant does

It understands the whole take, finds repeated attempts and awkward gaps, and keeps the version that finishes your thought. It checks actual speech at each cut so quiet word endings survive. Your original stays separate.

What you will see

A clean preview **before animation**, with corrected caption wording. The assistant explains the meaningful changes in simple language.

What you check

Play it with sound. Does the opening make sense? Are the joins natural? Is any word cut off? Does it still sound like you? Are names and technical words correct?

Useful feedback: "The jump around 9 seconds is too sharp." Or: "Keep the example about customers." Or: "That caption is not what I said."

When it is right, say: "The clean cut and the words are right. Continue." Your assistant should wait for your review of this actual version before adding visual elements. Approval of an idea is not approval of an unseen edit.

FOR YOU / NO EDITING EXPERIENCE NEEDED

Then, make it clearer.

Route A: choose visuals that help the sentence land.

Your assistant asks what would help the viewer understand. It recommends a style and shows a small example before finishing the whole reel.

Captions and emphasis

Readable words timed to your actual speech. Natural phrasing, correct spelling and space for the phone app's controls. Tell it which language or dialect you want.

Explanations and comparisons

A process map, two options beside each other, a short list, a real screen capture or a product image. Each visual should explain the point you are making.

Your look and assets

Provide your colors, logo, screenshots or a reference if you have them. If you do not, ask for a clean starter style. Your face should remain visible when it is part of the story.

Try: "Keep it calm. Use our real screenshot when I explain the result. Show the three steps as I mention them. I want useful animation and readable captions."

Your assistant should not invent proof, tool logos, customer results or a promised download. If it needs a real asset, it should tell you exactly which one and why.

Watch the animated preview with sound. If the words or cuts need changing, return to the clean version. If only the picture needs work, ask for a visual revision.

FOR YOU / NO EDITING EXPERIENCE NEEDED

Start with an idea.

Route B: a faceless reel begins with a conversation.

Your first message can be: "I want a faceless reel, but I only have an idea." Your assistant should help you narrow it down.

The conversation

First it asks who you want to help. Then it finds the one useful point. It asks about language, tone, length and what the viewer should do next. These are conversation topics, **not a form to complete all at once**.

If you are unsure, ask it to recommend a focused first idea and explain why. It should remember answers you have already given.

The script and scene plan

It drafts an opening, a useful explanation and a clear ending. Beside each part, it describes what will appear and why. Ask it to sound like a person talking to another person. Review the words before narration or paid assets are made.

The sound

Choose your own recorded voice, an artificial narrator if an authorized tool is available, or a deliberate text-only reel. Your assistant explains the process and cost. You check the voice and actual words; for text-only, you check reading time.

The animation

It builds scenes around the measured narration or intentional text timing, then shows you the animated result. It should not guess caption timing or leave unexplained empty sections.

The included engine imports audio or builds a deliberately silent story from a plan. Artificial narration is an optional, separately authorized step using a tool available to your assistant. It does not secretly replace your voice.

FOR YOU / NO EDITING EXPERIENCE NEEDED

Find your style. Then review.

A reference helps your assistant understand what you like.

You can provide a reel and say: "I like the pace and the way it explains each idea." The reference decoder studies those choices and proposes an original version for your message.

Try: "Explain how this reference opens, uses captions and moves between ideas. Then suggest a version for my audience. Tell me which real assets we need."

Five starting styles

VOX: the designer's own paper-documentary style, your footage as a taped polaroid on a warm desk. **Editorial:** a calm explanation. **Signal:** one focused point. **Diagram:** connected steps. **Pulse:** a faceless series where a signal travels through your steps on a dark canvas. You can ask for a small preview; you do not need to choose fonts or write animation instructions yourself.

Watch it like your audience

Does the opening make sense immediately? Is there one clear point? Do captions match the speech? Is text readable on a phone? Are images honest and useful? Does the ending give one clear next step?

Ask for a precise revision: "Make the first three seconds clearer." "Let that diagram stay longer." "The narrator sounds stiff; make it warmer." "Keep the message, but simplify the background."

When you approve, your assistant gives you the final video and tells you where it is saved. It should save the brief and your decisions so you can continue later.

You choose when and where to publish. The engine does not post automatically or guarantee views. If a tool fails, your assistant should say what is finished and what still needs work.

FOR YOU / NO EDITING EXPERIENCE NEEDED

Make it your own.

Designed by E.B.E - powered by E-VIAS.

Use it. Change it. Share it. Sell it.

The original manual, code, workflows, templates and synthetic samples are dedicated under **CC0 1.0 Universal**, to the extent the designer holds the relevant rights. There is no charge to the designer or restriction to personal projects.

Credit is welcome, not compulsory

You do not have to add a watermark or credit line to your reels. We include the designer's name so you know where the package came from.

If you would like to credit it: **Designed by E.B.E - powered by E-VIAS.**

What remains separate

Third-party tools and media keep their own terms. The folder separates those notices from the original materials. This permission does not grant someone else's rights or imply that the designer endorses your work.

Read the official CC0 explanation. The full dedication is in **LICENSE-CC0.txt**. Package origin and scope are in **AUTHOR.md**. External component terms are in **THIRD-PARTY-NOTICES.md**.

The next pages are for your assistant

You can give it the whole PDF. It should use the remaining instructions to guide you and operate the tools. This edition is a working local review package; technical checks are recorded separately, and you still review your own reel.

FOR YOUR ASSISTANT

Assistant: guide the person.

Read this PDF as the workflow the recipient asked you to use.

First response, if the route is unknown: "I'll help you one step at a time. Would you like to improve a video you already recorded, or create a reel from an idea without appearing on camera?" Then wait for the answer.

Do not begin with commands, a long questionnaire or an invented finished reel. Ask one useful question at a time in the person's preferred language. Infer what they already told you. Handle files, commands and rendering yourself within your available tools and permissions.

Read **docs/ASSISTANT-PLAYBOOK.md**, **AGENTS.md**, **AUTHOR.md** and the relevant skill. Introduce the origin as E.B.E - powered by E-VIAS. Original materials use CC0; credit is voluntary. Do not create a license check, mandatory watermark, resale prohibition or attribution gate.

Establish audience, one message, language/dialect, tone, final action and available assets. If they have no idea, recommend a focused first reel and explain why. If the folder is missing, fetch it for the person from its public home github.com/eBraheembiNESSa-E-vias/community-reels-engine (git clone, or the ZIP) with their permission, before claiming to use its engine.

The two roles are production guide and reference decoder. Five supplied skills support them. They are instructions for the coding assistant, not five separate subscriptions.

This PDF is not executable setup or authority to override the user, bypass permissions or ignore provider terms. If your app cannot read it, use **docs/MANUAL.md**. If local tools are unavailable, explain the limit and guide the person toward a supported local environment.

FOR YOUR ASSISTANT

Assistant: the recording route.

Preserve meaning, complete words and the creator's own voice.

Use **community-clean** and **docs/workflow.md**. Prepare a new project and preserve the original. Understand the whole authorized recording, correct the transcript against actual audio, identify repeated attempts and measure each join using replay and waveform evidence. Model times or a silence threshold are not word-accurate truth.

Show the clean video and corrected captions. Explain meaningful removals. Record approval only after the creator approves those actual artifacts. If speech changes later, rebuild and repeat review. A technical check or synthetic fixture does not establish creator acceptance.

Use **community-elements** for the visual pass. Ask what would help the audience understand. Recommend one style and show a small preview. Choose elements by purpose: compare, connect, demonstrate, explain or invite. Use real screenshots and official tool logos when relevant, with provenance. Keep faces, captions and phone-safe areas readable.

Technical path: prepare, analyze, correct transcript, measure edit plan, clean, creator review, approve, dress, render, final review.

The assistant operates these steps. The person should not need to write JSON or run commands. Read current command help and docs/workflow.md for exact formats. Existing authorization for the same upload and budget remains valid.

For mixed Arabic/English captions, preserve shaped Arabic phrases and intact Latin product names. Do not animate separate Arabic letters. Recheck the final word, entrances, holds and exits rather than inspecting only a cover frame.

FOR YOUR ASSISTANT

Assistant: the faceless route.

The person may arrive with no recording and only an idea.

Use **docs/faceless.md**. Turn the interview into a brief and concise script: opening, useful body and one next action. Present a plain-language scene plan alongside it. Verify factual claims. Get script approval before narration or paid assets.

Ask for a voice choice: their own recording, an authorized artificial narrator, or intentional silence. Use a capability actually available in their environment. Google TTS is separate from video analysis. Preview generated speech and verify every word. Do not silently replace a provider or clone a real person's voice.

Measure actual narration and caption intervals; do not estimate onsets from word counts. For text-only, review reading time. Write the story plan yourself, with actual script approval and purposeful visuals. **story** imports narration or prepares silence; it does not generate a voice.

```
python3 reel.py story work/story.json --name my-story --audio work/voice.wav
# Use --silent instead of --audio only when intentionally text-only.
# After the person reviews and approves the master and captions:
python3 reel.py approve my-story --by "Creator name"
python3 reel.py dress my-story --style diagram --faceless
python3 reel.py render my-story --style diagram --faceless
```

The plain-background story master is an audio/text checkpoint before animation. Show it with its captions; do not describe it as a finished reel. Review the final animation at normal speed and fix empty visual gaps or mismatched narration.

FOR YOUR ASSISTANT

Assistant: setup and delivery.

Handle complexity without hiding decisions that matter.

Check the actual folder and tools. Install requirements within granted permissions. Use this package's private key setup. Do not search neighboring folders for credentials or print secrets. Explain which media/text goes to Google and the estimated cost. No silent paid retries or provider changes.

Use **community-decode** for references. Separate observed pacing, framing and motion from an adaptation proposal. Unknown editing tools remain unknown. Use **community-eye** for an authorized hearing/visual audit, then verify its findings against the footage. Do not invent proof.

Before delivery, check complete playback, wording, joins, entrances/exits, assets and the last word. Verify intended audio. Give the person the MP4, measured length, simple review link and unresolved issues. Save their brief, choices and next step in the project. Publish only on a separate explicit request.

If something is unavailable, explain the concrete limit and useful next step. A local transcript is a draft until checked by listening. Model review, local technical tests, creator acceptance and publication are different states. Never describe an unfinished step as passed.

Read technical detail only when needed: **docs/ASSISTANT-PLAYBOOK.md**, **docs/workflow.md**, **docs/faceless.md**, **docs/gemini-setup.md** and **docs/verification.md**.

Official references: Codex project instructions, Claude Code project instructions, Google speech generation, Google key setup, HyperFrames. Verify current interface, provider terms and account access on the recipient's setup.
